

ConsertaPraMim - App Summary

Source: repo files under C:/Leonardo/Labs/ConsertaPraMimWeb (code + docs only).

What it is

ConsertaPraMim is a multi-app service marketplace platform that connects clients with service providers and gives admins operational control.

This repo contains a .NET API, web portals (admin/client/provider/landing), and React + Vite mobile-webview apps (client/provider/admin/fire TV).

Who it is for

Primary persona: end customers who need to request, track, and finalize home services from a mobile-first client app.

What it does

- Authenticates users with JWT via /api/auth/login and /api/auth/register.
- Lets clients open requests with categories, address/ZIP enrichment, and guided flow steps.
- Shows active/history orders and request timelines from mobile endpoints.
- Supports provider proposals, comparison, acceptance, and appointment scheduling.
- Delivers real-time notifications and chat through SignalR hubs (/notificationHub and /chatHub).
- Provides provider dashboards/requests/proposals and admin monitoring/analytics views, including Fire TV dashboard feed.

How it works (architecture)

- Backend follows layered architecture: API + Application + Domain + Infrastructure projects.
- API registers controllers, Swagger/OpenAPI, JWT auth, CORS, health check, and SignalR hubs.
- Application layer contains use-case services for auth, orders, proposals, chat, scheduling, admin, push, and analytics.
- Infrastructure layer wires SQL Server EF Core DbContext, repositories, local file storage, Firebase push, OpenAI gateway, and Google Calendar services.
- Data flow: web/mobile clients call REST endpoints and hubs; API delegates to application services; services persist/read via repositories in SQL Server.
- External broker/queue infrastructure: Not found in repo.

How to run (minimal)

- Start API: cd Backend; dotnet run --project src/ConsertaPraMim.API/ConsertaPraMim.API.csproj --launch-profile http --urls http://0.0.0.0:5193
- Open client app folder: cd "conserta-pra-mim app"
- Install deps on Windows: cmd.exe /c npm install
- Set .env.local with GEMINI_API_KEY and (optionally) VITE_API_BASE_URL=http://127.0.0.1:5193
- Run app: cmd.exe /c npm run dev (configured Vite port: 3000).
- Single-command local full-stack bootstrap script: Not found in repo.
